ABSTRACT

A process for producing a poly(arylene sulfide),
comprising the respective steps of a washing step of

5 washing a polymer separated from a reaction mixture
containing the polymer formed with an organic solvent,
which is arranged after a polymerization step, a
purification step of purifying the organic solvent
recovered after the washing step to lower the content of an

10 alkaline compound mixed therein, and a step of recycling
the purified organic solvent through the washing step of
the poly(arylene sulfide).
